

CHAPTER 3

Hopf Algebras, Algebraic, Formal, and Quantum Groups

7. The quantum monoid of a quantum space

Problem 3.7.1. If A is a finite dimensional algebra and $\delta : A \rightarrow M(A) \otimes A$ the universal cooperation of the Tambara bialgebra on A from the left then $\tau\delta : A \rightarrow A \otimes M(A)$ (with the same multiplication on $M(A)$) is a universal cooperation of $M(A)$ on A from the right. The comultiplication defined by this cooperation is $\tau\Delta : M(A) \rightarrow M(A) \otimes M(A)$. Thus we have to distinguish between the left and the right Tambara bialgebra on A and we have $M_r(A) = M_l(A)^{cop}$.

Now consider the special monoidal diagram scheme $\mathcal{D} := \mathcal{D}[X; m, u]$. To make things simpler we assume that \mathbf{Vec} is strict monoidal. The category $\mathcal{D}[X; m, u]$ has the objects $X \otimes \dots \otimes X = X^{\otimes n}$ for all $n \in \mathbb{N}$ (and $I := X^{\otimes 0}$) and the morphisms $m : X \otimes X \rightarrow X$, $u : I \rightarrow X$ and all morphisms formally constructed from m, u, id by taking tensor products and composition of morphisms.

Let A be an algebra with multiplication $m_A : A \otimes A \rightarrow A$ and unit $u_A : \mathbb{K} \rightarrow A$. Then $\omega_A : \mathcal{D} \rightarrow \mathcal{C}$ defined by $\omega(X) = A$, $\omega(X^{\otimes n}) = A^{\otimes n}$, $\omega(m) = m_A$ and $\omega(u) = u_A$ is a strict monoidal functor. If A is finite dimensional then the diagram is finite. We get

Theorem 3.7.1. *Let A be a finite dimensional algebra. Then the algebra $M(A)$ coacting universally from the right on A (the right Tambara bialgebra) $M(A)$ and $\text{coend}(\omega_A)$ are isomorphic as bialgebras.*

PROOF. We have studied the Tambara bialgebra for left coaction $f : A \rightarrow M(A) \otimes A$ but here we need the analogue for universal right coaction $f : A \rightarrow A \otimes M(A)$ (see Problem 3.9).

Let B be an algebra and $f : A \rightarrow A \otimes B$ be a homomorphism of algebras. For $\omega = \omega_A$ we define

$$\varphi(X^{\otimes n}) : \omega(X^{\otimes n}) = A^{\otimes n} \xrightarrow{f^{\otimes n}} A^{\otimes n} \otimes B^{\otimes n} \xrightarrow{1 \otimes m_B^n} A^{\otimes n} \otimes B = \omega(X^{\otimes n}) \otimes B,$$

where $m_B^n : B^{\otimes n} \rightarrow B$ is the n -fold multiplication on B . The map φ is a natural transformation since the diagrams

$$\begin{array}{ccc} \mathbb{K} & \xrightarrow{\varphi(I)} & \mathbb{K} \otimes B \\ \downarrow u & & \downarrow 1 \otimes u \\ A & \xrightarrow{\varphi(X)} & A \otimes B \end{array}$$

and

$$\begin{array}{ccccc}
 A \otimes A & \xrightarrow{\varphi(X \otimes X)} & A \otimes A \otimes B \\
 \downarrow m & \nearrow f \otimes f & \searrow 1 \otimes m \\
 & A \otimes A \otimes B \otimes B & \\
 & \downarrow m \otimes m & \\
 & A \otimes B & \\
 \nearrow f & \searrow 1 \otimes 1 & \\
 A & \xrightarrow{\varphi(X)} & A \otimes B
 \end{array}$$

commute. Furthermore the following commute

$$\begin{array}{ccccc}
 A^{\otimes r} \otimes A^{\otimes s} & \xrightarrow{\varphi(X^{\otimes r}) \otimes \varphi(X^{\otimes s})} & A^{\otimes r} \otimes A^{\otimes s} \otimes B \otimes B \\
 \downarrow & \nearrow & \searrow \\
 & A^{\otimes r} \otimes A^{\otimes s} \otimes B^{\otimes r} \otimes B^{\otimes s} & \\
 & \downarrow & \\
 & A^{\otimes(r+s)} \otimes B^{\otimes(r+s)} & \\
 \nearrow & \searrow & \\
 A^{\otimes(r+s)} & \xrightarrow{\varphi(X^{\otimes(r+s)})} & A^{\otimes(r+s)} \otimes B
 \end{array}$$

so that $\varphi : \omega_A \rightarrow \omega_A \otimes B$ is a monoidal natural transformation.

Conversely let $\varphi : \omega_A \rightarrow \omega_A \otimes B$ be a natural transformation. Let $f := \varphi(X) : A \rightarrow A \otimes B$. Then the following commute

$$\begin{array}{ccc}
 A \otimes A & \xrightarrow{f \otimes f} & A \otimes A \otimes B \otimes B \\
 \downarrow = & & \downarrow 1 \otimes m \\
 A \otimes A & \xrightarrow{\varphi(X \otimes X)} & A \otimes A \otimes B \\
 \downarrow m & & \downarrow m \otimes 1 \\
 A & \xrightarrow{f} & A \otimes B
 \end{array}$$

and

$$\begin{array}{ccc}
 \mathbb{K} & \xrightarrow{\cong} & \mathbb{K} \otimes \mathbb{K} \\
 \downarrow = & & \downarrow \\
 \mathbb{K} & \xrightarrow{\quad} & \mathbb{K} \otimes B \\
 \downarrow u & & \downarrow u \otimes 1 \\
 A & \xrightarrow{f} & A \otimes B.
 \end{array}$$

Hence $f : A \rightarrow A \otimes B$ is a homomorphism of algebras.

Thus we have defined an isomorphism

$$\mathbb{K}\mathbf{Alg}(A, A \otimes B) \cong \text{Nat}^{\otimes}(\omega_A, \omega_A \otimes B)$$

that is natural in B . If A is finite dimensional then the left hand side is represented by the Tambara bialgebra $M_r(A)$ and the right hand side by the bialgebra $\text{coend}(\omega_A)$. Thus both bialgebras must be isomorphic. \square

Corollary 3.7.2. *There is a unique isomorphism of bialgebras $M_r(A) \cong \text{coend}(\omega_A)$ such that the diagram*

$$\begin{array}{ccc} A & \longrightarrow & A \otimes M_r(A) \\ & \searrow & \downarrow \\ & & A \otimes \text{coend}(\omega_A) \end{array}$$

commutes

PROOF. This is a direct consequence of the universal property. \square

Thus the Tambara bialgebra that represents the universal quantum monoid acting on a finite quantum space may be reconstructed by the Tannaka-Krein reconstruction from representation theory. Similar reconstructions can be given for more complicated quantum spaces such as so called quadratic quantum spaces.
