イロト イポト イヨト イヨト

#### Definition

Feature subset selection - the process of selecting the relevant features for use in model construction.

Intuitively one might think, that the more features there are, the better we can perform our training...

Elizaveta Pechenova

Wrapper Approac

Embedded Approach

Bibliography

#### A simple example

- illustration: have a look at iris dataset
- introduce a third random variable

#### **Bias-Variance Dilemma**

Elizaveta Pechenova

#### Definition of the problem 00000

## Reasons for using dimensionality reduction

- to improve prediction performance
- to improve learning efficiency
- to provide faster predictors requiring less information
- to reduce complexity of the learned results and enable better understanding of the underlying process
- to prevent over-fitting

"Here's a list of 100,000 warehouses full of data. I'd like you to condense them down to one meaningful warehouse."

# Principal Component Analysis: Motivation

A synthetic data set obtained by taking one of the off-line digit images and creating multiple copies in each of which the digit has undergone a random displacement and rotation within some larger image field. The resulting images each have  $100 \times 100 = 10,000$  pixels.

- simply three degrees of freedom
- vertical and horizontal translations and the rotations
- each image represented by 10000 pixels

Wrapper Approac

Embedded Approach

Bibliography

# Filtering: Principal Component Analysis

#### Main idea

PCA ... [is] defined as the orthogonal projection of the data onto a lower dimensional linear space, known as the principal subspace, such that the variance of the projected data is maximized [2, 561]

In other words we want to perform dimensionality reduction and keep as much information as possible.

	Filtering Approach		
PCA

LMU Munich

Elizaveta Pechenova

Wrapper Approac

Embedded Approach

< ロ > < 同 > < 回 > < 回 >

PCA

## Coming back to the example:

The mean vector  $\overline{\mathbf{x}}$  along with the first four PCA eigenvectors  $\mathbf{u}_1, \ldots, \mathbf{u}_4$  for the off-line digits data set, together with the corresponding eigenvalues.

## Python implementation:

https://jakevdp.github.io/PythonDataScienceHandbook/
05.09-principal-component-analysis.html

## 3D example:

http://setosa.io/ev/principal-component-analysis/

Elizaveta Pechenova

(a)

- Calculate the covariance matrix
- Find the eigenvalues and eigenvectors of the covariance matrix
- Transform the data into the new coordinate system

Elizaveta Pechenova

Wrapper Approac

## Pros

- can be applied for data compression and dimensionality reduction
- first insight into the domain at hand – visualization of high dimensional data
- easy method for understanding the data especially in high dimensions
- helps to reduce noise

## Cons

- assumes linearity relations between the features
- variance is used as a measure of the importance of the particular dimension
- assumes that principle components are orthogonal

Bibliography

Variable ranking

# Variable ranking: classical statistics

- mutual information
- T-test
- $\chi^2$ -test

Elizaveta Pechenova

# Mutual Information between X and Y

#### Definition

Mutual information is a measure of mutual dependence between the chosen variable and the classification variable.

$$I(X;Y) = H(X) - H(X|Y) = \sum_{y \in Y} \sum_{x \in X} p(x,y) \log \left(\frac{p(x,y)}{p(x)p(y)}\right)$$

Mutual information only zero if X and Y are independent random variables.

イロト イヨト イヨト イヨト

Variable ranking

#### Hypothesis test

 $H_0$ : feature  $X_i$  is irrelevant to Y  $H_1$ :  $X_i$  is dependent to Y

Elizaveta Pechenova

Feature Selection

LMU Munich

	Filtering Approach		
Variable ranking			

 $\chi^2 - {\sf Test}$ 

 $\chi^2-{\rm Test}$  is based on the assumption, that the two events are independent:

$$P(A \land B) = P(A)P(B) \tag{1}$$

イロン イ団 と イヨン イヨン

#### Definition

Observed number:  $O_k$ Under  $H_0$  expected number:  $E_k$ 

$$\chi^{2} = \sum_{k=1}^{n} \frac{(O_{k} - E_{k})^{2}}{E_{k}}$$

Elizaveta Pechenova

# T-Test: Slope of the regression line

Have a look at the classification variable and one other feature Perform a hypothesis test:

- $H_0$ : the model created by just a constant
- $H_1$ : the model created by a constant and the feature

**1** calculate the Pearson correlation  $r = \frac{cov(x,y)}{\sqrt{Var(x)Var(y)}}$ 

$$Cov(x,y) = \sum_{i=1}^{n} (x_i - \bar{x})(y_i - \bar{y})$$

< ロ > < 同 > < 回 > < 回 > < 回 > <

	Filtering Approach		
Variable ranking			

## Nevertheless there is a difference...

https://scikit-learn.org/stable/auto\_examples/
feature\_selection/plot\_f\_test\_vs\_mi.html

- F-statistics is better in capturing linear relationships
- $\chi^2$  and MI almost the same for big sample sizes
- MI is easy to compute
- use filters to get rid of about the half of the features and use multiple of them

イロト 不得 トイヨト イヨト

Elizaveta Pechenova

イロト イポト イヨト イヨト

# Wrapper Approach

#### Main idea

Use the learning algorithm itself to evaluate the goodness of the feature subset. At each step remove different features from the subset. The subset with the highest evaluation is chosen as the final set on which to run the induction algorithm. [3]

The search space for n features has the dimensionality  $O(2^n)$ 

Elizaveta Pechenova

イロト イポト イヨト イヨト

# Wrapper Approach

- forward selection
- backward elimination
- random choice: e.g. generic algorithms algorithms using mutation, crossover and selection
- Problem: risk of over-fitting, computationally expensive
- not used in the era of big data

・ロマ・山マ・山マ・山マ・山

Elizaveta Pechenova

	Filtering Approach 000000 00000000	Embedded Approach 00●000	
Lasso regression			

- Lasso regression forces some weights to zero.
- implemented feature selection in the model
- lambda determines the size of the feature set: determined by the cross-validation risk estimate
- breaks down for non-linear methods, as no natural mapping between weights and data
- other approaches exist like feature vector machine: modification of Lasso regression, applies a kernel function K to the feature vectors
