Information systems Ideals Free algebras Totality

Computable functionals of finite types

- Gödel 1958: "Über eine bisher noch nicht benützte Erweiterung des finiten Standpunkts", namely computable finite type functions.
- Need partial continuous functionals as their intendend domain (Scott 1969). The total ones then appear as a dense subset (Kreisel 1959, Ershov 1972).
- Type theory of Martin-Löf 1983 deals with total (structural recursive) functionals only. Fresh start, based on (a simplified form of) information systems (Scott 1982).

- 4 同 6 4 日 6 4 日 6

Information systems Ideals Free algebras Totality

Atomic coherent information systems (acis's)

- Acis: (A, ⊂, ≥) such that ⊂ (consistent) is reflexive and symmetric, ≥ (entails) is reflexive and transitive and a ⊂ b → b ≥ c → a ⊂ c.
- Formal neighborhood: U ⊆ A finite and consistent. We write U ≥ a for ∃_{b∈U}b ≥ a, and U ≥ V for ∀_{a∈V}U ≥ a.
- ▶ Function space: Let $\mathbf{A} = (A, \smile_A, \ge_A)$ and $\mathbf{B} = (B, \smile_B, \ge_B)$ be acis's. Define $\mathbf{A} \to \mathbf{B} = (C, \smile, \ge)$ by

$$\begin{split} C &:= \operatorname{Con}_A \times B, \\ (U,b) &\smile (V,c) := U \smile_A V \to b \smile_B c, \\ (U,b) &\ge (V,c) := V \ge_A U \land b \ge_B c. \end{split}$$

 $\boldsymbol{A} \rightarrow \boldsymbol{B}$ is an acis again.

- 4 同 6 4 日 6 4 日 6

Information systems Ideals Free algebras Totality

Ideals, Scott topology

- Ideal: x ⊆ A consistent and deductively closed. |A| is the set of ideals (points, objects) of A.
- |A| carries a natural topology, with cones U
 := { z | z ⊇ U }

 generated by the formal neighborhoods U as basis.

Theorem (Scott 1982)

The continuous maps $f : |\mathbf{A}| \to |\mathbf{B}|$ and the ideals $r \in |\mathbf{A} \to \mathbf{B}|$ are in a bijective correspondence.

・ロト ・同ト ・ヨト ・ヨト

Information systems Ideals Free algebras Totality

Free algebras

are given by their constructors. Examples

- ► Natural numbers: 0, S.
- ▶ Binary trees: nil, C.
- Unit U: u.
- Booleans B: tt, ff.
- Signed digits **SD**: -1, 0, +1.
- Lists of signed digits L(SD): nil, d :: I.

We always require a nullary constructor.

Information systems Ideals Free algebras Totality

Turning free algebras into information systems

- Commonly done by adding \perp : "flat cpo".
- Problem 1: Constructors are not injective: C(⊥, b) = ⊥ = C(a, ⊥).
- ▶ Problem2 : Constructors do not have disjoint ranges: $C_1(\bot) = \bot = C_2(\bot).$
- Solution: Use as atoms constructor expressions involving a symbol *, meaning "no information".

- 4 同 6 4 日 6 4 日 6

(日) (同) (三) (三)

Information systems Ideals Free algebras Totality

Total and cototal ideals

For a base type ι , the total ideals are defined inductively:

- 0 is total (0 being the nullary constructor), and
- If \vec{z} are total, then so is $C\vec{z}$.

The cototal ideals x are those of the form $C\vec{z}$ with C a constructor of ι and \vec{z} cototal. – For example, in **L**(**SD**),

- the total ideals are the finite and
- the cototal ideals are the finite or infinite

lists of signed digits (\sim an interval with rational end points or a stream real, both in [-1, 1]).

Information systems Ideals Free algebras Totality

Totality in higher types, density

- An ideal r of type $\rho \to \sigma$ is total iff for all total z of type ρ , the result |r|(z) of applying r to z is total.
- Density theorem (Kreisel 1959, Ershov 1972, U. Berger 1993): Assume that all base types are finitary. Then for every U ∈ Con_ρ we can find a total x such that U ⊆ x.

Denotational semantics

• Define $(\vec{U}, b) \in \llbracket \lambda_{\vec{x}} M \rrbracket$:

$$\frac{U_i \ge b}{(\vec{U}, b) \in \llbracket \lambda_{\vec{x}} x_i \rrbracket}(V), \quad \frac{(\vec{U}, V) \subseteq \llbracket \lambda_{\vec{x}} N \rrbracket \quad (\vec{U}, V, c) \in \llbracket \lambda_{\vec{x}} M \rrbracket}{(\vec{U}, c) \in \llbracket \lambda_{\vec{x}} (MN) \rrbracket}(A).$$

For every constructor C and defined constant D

$$\frac{\vec{V} \ge \vec{b^*}}{(\vec{U}, \vec{V}, C\vec{b^*}) \in \llbracket \lambda_{\vec{x}} C \rrbracket}(C), \qquad \frac{(\vec{U}, \vec{V}, b) \in \llbracket \lambda_{\vec{x}, \vec{y}} M \rrbracket}{(\vec{U}, \vec{P}(\vec{V}), b) \in \llbracket \lambda_{\vec{x}} D \rrbracket}(D),$$

with one rule (D) for every computation rule $D\vec{P}(\vec{y}) = M$. • $\llbracket M \rrbracket_{\vec{x}}^{\vec{U}} := \{ b \mid (\vec{U}, b) \in \llbracket \lambda_{\vec{x}} M \rrbracket \}$ and $\llbracket M \rrbracket_{\vec{x}}^{\vec{u}} := \bigcup_{\vec{U} \subset \vec{u}} \llbracket M \rrbracket_{\vec{x}}^{\vec{U}}$.

Constants defined by computation rules Denotational semantics: preservation of values Operational semantics: adequacy

・ 同 ト ・ ヨ ト ・ ヨ ト

Properties

- $[\lambda_{\vec{x}} M]$ is an ideal, i.e., consistent and deductively closed.
- (Monotonicity) If $\vec{v} \supseteq \vec{u}$, $b \ge c$ and $b \in \llbracket M \rrbracket_{\vec{x}}^{\vec{u}}$, then $c \in \llbracket M \rrbracket_{\vec{x}}^{\vec{v}}$.
- (Substitution) $\llbracket M(z) \rrbracket_{\vec{x},z}^{\vec{u}, \llbracket N \rrbracket_{\vec{x}}^{\vec{u}}} = \llbracket M(N) \rrbracket_{\vec{x}}^{\vec{u}}$.
- (Beta) $\llbracket (\lambda_y M(y)) N \rrbracket_{\vec{x}}^{\vec{u}} = \llbracket M(N) \rrbracket_{\vec{x}}^{\vec{u}}$.
- ► (Eta) $\llbracket \lambda_y(My) \rrbracket_{\vec{x}}^{\vec{u}} = \llbracket M \rrbracket_{\vec{x}}^{\vec{u}}$ if $y \notin FV(M)$.

Constants defined by computation rules Denotational semantics: preservation of values Operational semantics: adequacy

Preservation of values

Theorem (Substitution of constructor terms) $(\vec{U}, \vec{V}, b) \in [\![\lambda_{\vec{x}, \vec{y}} M(C\vec{y})]\!] \leftrightarrow (\vec{U}, C\vec{V}, b) \in [\![\lambda_{\vec{x}, z} M(z)]\!]$, with the same height and D-height.

Corollary (Preservation of values under computation rules) For every computation rule $D\vec{P}(\vec{y}) = M$ of a defined constant D, $[\![\lambda_{\vec{y}}(D\vec{P}(\vec{y}))]\!] = [\![\lambda_{\vec{y}} M]\!].$

Constants defined by computation rules Denotational semantics: preservation of values Operational semantics: adequacy

- 4 同 6 4 日 6 4 日 6

Head reduction

Define $M \succ_1 N$, M head-reduces to N:

$$\begin{split} &(\lambda_x \ M(x))N \succ_1 \ M(N), \\ &\frac{M \succ_1 \ M'}{MN \succ_1 \ M'N}, \\ &D\vec{P}(\vec{N}) \succ_1 \ M(\vec{N}) \quad \text{for } D\vec{P}(\vec{y}) = M(\vec{y}) \text{ a computation rule,} \\ &\frac{N \succ_1 \ N'}{MN \succ_1 \ MN'} \quad \text{for } M \text{ in head normal form.} \end{split}$$

Constants defined by computation rules Denotational semantics: preservation of values Operational semantics: adequacy

- 4 同 6 4 日 6 4 日 6

Operational semantics

Define $M \in [a]$, for M closed:

▶ For a of base type ι , $M \in [a]$ iff $\exists_{N \geq a} M \succeq N$.

• $M \in [(U, b)]$ iff $M \succeq \lambda_x M'$ or M in head normal form, and $\forall_{N \in [U]} MN \in [b]$.

Write $M \in [U]$ for $\forall_{a \in U} M \in [a]$ (operational interpretation of formal neighborhoods, Martin-Löf 1983). – Plotkin (1977) proved: Whenever an atom *b* belongs to the value of a closed term *M*, then *M* head-reduces to an atom entailing *b*. Here we have more generally:

Theorem (Adequacy)

$$(\vec{U}, b) \in \llbracket \lambda_{\vec{x}} M \rrbracket \rightarrow \lambda_{\vec{x}} M \in [(\vec{U}, b)].$$

Examples: totality, Leibniz equality, existence, conjunction Decidable prime formulas, ex-falso-quodlibet, stability Coinductive definition of cototality

Formulas, predicates, clauses: general definition

Let X be a fixed predicate variable. Formulas $A, B, C, D \in F$, predicates $P, Q, I \in Preds$ and constructor formulas (or clauses) $K \in KF_X$ are generated inductively:

$$\frac{\vec{A}, \vec{B}_{0}, \dots, \vec{B}_{n-1} \in F}{\left\{ \forall_{\vec{x}} (\vec{A} \to \left(\forall_{\vec{y}_{\nu}} (\vec{B}_{\nu} \to X(\vec{s}_{\nu})) \right)_{\nu < n} \to X(\vec{t}) \right) \in \mathrm{KF}_{X}} \quad (n \ge 0) \\
\frac{K_{0}, \dots, K_{k-1} \in \mathrm{KF}_{X} \quad (k \ge 1)}{\mu_{X}(K_{0}, \dots, K_{k-1}) \in \mathrm{Preds}} \quad \frac{P \in \mathrm{Preds}}{P(\vec{r}) \in \mathrm{F}} \quad \frac{C \in \mathrm{F}}{\{ \vec{x} \mid C \} \in \mathrm{Preds}} \\
\frac{A, B \in \mathrm{F}}{A \to B \in \mathrm{F}} \quad \frac{A \in \mathrm{F}}{\forall_{x^{\rho}} A \in \mathrm{F}}.$$

We always require a nullary clause.

Examples: totality, Leibniz equality, existence, conjunction Decidable prime formulas, ex-falso-quodlibet, stability Coinductive definition of cototality

< ロ > < 同 > < 回 > < 回 >

Logic of inductive definitions LID

LID is the (extensional) system in minimal logic for \rightarrow and \forall , whose formulas are those in F above, and whose axioms are, for each inductively defined predicate, introduction or closure axioms, together with an elimination or least fixed point axiom.

Example

Totality T_N is inductively defined by

$$T_{\mathbf{N}}(0),$$

$$\forall_{n}(T_{\mathbf{N}}(n) \to T_{\mathbf{N}}(\mathrm{S}n)),$$

$$\forall_{n \in T} (A(0) \to \forall_{n \in T} (A(n) \to A(\mathrm{S}n)) \to A(n^{\mathbf{N}})).$$

Examples: totality, Leibniz equality, existence, conjunction Decidable prime formulas, ex-falso-quodlibet, stability Coinductive definition of cototality

Further examples of inductively defined predicates

- ► Leibniz equality. Eq⁺: \forall_x Eq(x,x), Eq⁻: $\forall_{x,y}$ (Eq(x,y) $\rightarrow \forall_x C(x,x) \rightarrow C(x,y)$).
- ► Existence. $\exists^+ : \forall_x (A \to \exists_x A)$. $\exists^- : \exists_x A \to \forall_x (A \to C) \to C \text{ with } x \notin FV(C)$.
- ► Conjunction. \wedge^+ : $A \to B \to A \wedge B$. \wedge^- : $A \wedge B \to (A \to B \to C) \to C$.

Examples: totality, Leibniz equality, existence, conjunction Decidable prime formulas, ex-falso-quodlibet, stability Coinductive definition of cototality

Properties of Leibniz equality

Recall Eq⁺:
$$\forall_x \text{Eq}(x, x)$$
,
Eq⁻: $\forall_{x,y}(\text{Eq}(x, y) \rightarrow \forall_x C(x, x) \rightarrow C(x, y))$.
Lemma (Compatibility of Eq)
 $\forall_{x,y}(\text{Eq}(x, y) \rightarrow A(x) \rightarrow A(y))$.
Proof.

Use Eq⁻ with
$$C(x, y) := A(x) \rightarrow A(y)$$
.

Using compatibility of Eq one easily proves symmetry and transitivity.

Image: Image:

(*) *) *) *)

・ロト ・同ト ・ヨト ・ヨト

Decidable prime formulas, falsity

Using Leibniz equality, we can lift a boolean term r to a prime formula Eq(r, tt). Define falsity by F := Eq(ff, tt).

Theorem (Ex Falso Quodlibet)

 $\mathbf{F} \rightarrow A$.

Proof.

We first show $\mathbf{F} \to \text{Eq}(x^{\rho}, y^{\rho})$. Notice: from Eq(ff, tt) we obtain Eq[**if** tt **then** x **else** y][**if** ff **then** x **else** y] by compatibility. Hence Eq(x^{ρ}, y^{ρ}).

Now use induction on $A \in F$. Case $I(\vec{s})$. Let K_i be the nullary clause, with final conclusion $I(\vec{t})$. By IH from **F** we can derive all parameter premises. Hence $I(\vec{t})$. From **F** we also obtain $Eq(s_i, t_i)$. Hence $I(\vec{s})$ by compatibility. Cases $A \to B$ and $\forall_x A$: obvious.

Examples: totality, Leibniz equality, existence, conjunction Decidable prime formulas, ex-falso-quodlibet, stability Coinductive definition of cototality

Embedding PA^ω

- Define ¬A := A → F, ∃̃_xA := ¬∀_x¬A weak (or "classical") existence.
- ▶ Decidable equality for finitary base types: $=_{\iota} : \iota \to \iota \to \mathbf{B}$.

• A is stable if
$$\neg \neg A \rightarrow A$$
.

▶ $\forall_{p \in T} (\neg \neg Eq(p, tt) \rightarrow Eq(p, tt))$ by boolean induction.

Lemma (Stability)

If A has a stable end conclusion, then $\neg \neg A \rightarrow A$.

Examples: totality, Leibniz equality, existence, conjunction Decidable prime formulas, ex-falso-quodlibet, stability Coinductive definition of cototality

Cototality

Cototality $\mathcal{T}^{\infty}_{\mathbf{N}}$ is coinductively defined by the clause

$$\forall_n^{\mathsf{U}}(T^{\infty}_{\mathsf{N}}(n) \to n = 0 \lor \exists_m (n = \mathrm{S}m \land T^{\infty}_{\mathsf{N}}(m)))$$

and the greatest fixed point axiom

$$\begin{array}{l} \forall_n^{\mathsf{U}}(\mathcal{A}(n) \rightarrow \\ \forall_n^{\mathsf{U}}(\mathcal{A}(n) \rightarrow n = 0 \lor \exists_m [n = \mathrm{S}m \land (\mathcal{A}(m) \lor T^{\infty}_{\mathsf{N}}(m))]) \rightarrow \\ T^{\infty}_{\mathsf{N}}(n)). \end{array}$$

The greatest fixed point axiom is called coinduction.

Why extract computational content from proofs?

- Proofs are machine checkable \Rightarrow no logical errors.
- ► Program on the proof level ⇒ maintenance becomes easier. Possibility of program development by proof transformation (Goad 1980).
- Discover unexpected content:
 - ► U. Berger 1993: Tait's proof of the existence of normal forms for the typed λ-calculus ⇒ "normalization by evaluation".
 - Content in weak (or "classical") existence proofs, of

$$\tilde{\exists}_{x}A := \neg \forall_{x} \neg A,$$

via proof interpretations: (refined) A-translation or Gödel's Dialectica interpretation.

Decorating proofs

Goal: Insertion of uniformity marks (Berger 2005) into a proof.

- ► The sequent Seq(M) of a proof M consists of its context and its end formula.
- The uniform proof pattern UP(M) of a proof M is the result of changing in M all occurrences of →, ∀, ∃, ∧ in its formulas into their uniform counterparts →^U, ∀^U, ∃^U, ∧^U, except the uninstantiated formulas of axioms and theorems.
- A formula D extends C if D is obtained from C by changing some connectives into one of their more informative versions, according to the following ordering: →^U≤→, ∀^U ≤ ∀, ∃^U ≤ ∃^L, ∃^R ≤ ∃ and ∧^U ≤ ∧^L, ∧^R ≤ ∧.
- A proof N extends M if (1) UP(M) = UP(N), and (2) each formula in N extends the corresponding one in M. In this case FV([[N]]) is essentially (i.e., up to extensions of assumption formulas) a superset of FV([[M]]).

Decoration algorithm

Theorem (Ratiu, S)

For every uniform proof pattern U and every extension of its sequent Seq(U) we can find a decoration M_{∞} of U such that

- (a) $\operatorname{Seq}(M_{\infty})$ extends the given extension of $\operatorname{Seq}(U)$, and
- (b) M_{∞} is optimal in the sense that any other decoration M of U whose sequent Seq(M) extends the given extension of Seq(U) has the property that M also extends M_{∞} .
