Exercises for Stochastic Processes

Tutorial exercises:

T1. (a) Show that τ is a stopping time iff $\forall t \geq 0 : \{\tau < t\} \in \mathfrak{F}_t$!

(b) Let (τ_n) be a sequence of stopping times. Show that $\sup_n \tau_n$, $\inf_n \tau_n$, $\limsup_n \tau_n$, $\liminf_n \tau_n$ and, if existent, $\lim_n \tau_n$ are stopping times!

T2. Let $\tau, (\tau_n)$ be stopping times w.r.t. the right-continuous filtration $(\mathfrak{F}_t)$ associated to Brownian motion.

(a) Show that

$$\mathfrak{F}_\tau := \{A \mid \forall t \geq 0 : A \cap \{\tau \leq t\} \in \mathfrak{F}_t\}$$

is a σ-algebra!

(b) Show that, if $\tau_1 \leq \tau_2$, then $\mathfrak{F}_{\tau_1} \subset \mathfrak{F}_{\tau_2}$!

(c) Show that, if $\tau_n \downarrow \tau$, then $\mathfrak{F}_\tau = \bigcap_n \mathfrak{F}_{\tau_n}$!

T3. Determine the distribution of

(a) $\tau_1 := \inf\{t \geq 1 \mid B_t = 0\}$ and

(b) $\tau_2 := \sup\{t < 1 \mid B_t = 0\}$

for a Brownian motion B starting in the origin!

→ Page 2

Homework exercises:

H1. Show that, if B is a Brownian motion and τ a finite stopping time (w.r.t. the corresponding right-continuous filtration $(\mathfrak{F}_t)$), then $Y_t := B_{\tau+t} - B_\tau$ defines a Brownian motion, which is independent of $\mathfrak{F}_\tau$!

H2. The "tail σ-algebra" w.r.t. Brownian motion $B_t(\omega) = \omega(t)$ on $C[0,\infty[$ is defined as

$$\mathfrak{T} := \bigcap_{t>0} \sigma\left(\{B_s \mid s \geq t\}\right) .$$

(a) Show that, for any $A \in \mathfrak{T}$, $\mathbb{P}^x(A) \in \{0,1\}$!

(b) Show that $P^x(A)$ does not depend on x!

H3. Show that the (ω-dependent) set of times at which a Brownian motion has local maxima is a.s. dense in $\mathbb{R}_0^+$!

H4. (a) Let B be a Brownian motion starting in the origin, $a > 0$ and

$$\tau_a := \inf\{t > 0 \mid B_t - t = a\} .$$

Show that, for $a, b > 0$,

$$\mathbb{P}(\tau_{a+b} < \infty \mid \tau_a < \infty) = \mathbb{P}(\tau_b < \infty)\,!$$

(b) Conclude that $\sup_{t\geq 0}(B_t - t)$ has an exponential distribution!
