LIE ALGEBRAS

Joachim Wehler

Problems 01 (*Repetition*)

1. Determine the radius of convergence of the following power series:

i)
$$\sum_{\nu=0}^{\infty} \frac{1}{\nu!} \cdot z^{\nu}$$

ii)
$$\sum_{\nu=0}^{\infty} z^{\nu}$$

iii)
$$\sum_{\nu=1}^{\infty} \frac{(-1)^{\nu+1}}{\nu} \cdot z^{\nu}$$

iv)
$$\sum_{\nu=0}^{\infty} \frac{(-1)^{\nu}}{(2\nu)!} \cdot z^{2\nu}$$

v)
$$\sum_{\nu=0}^{\infty} \nu! \cdot z^{\nu}$$

vi) Which well-known functions do the power series i) - iv) represent?

2. Consider the field $\mathbb{K} = \mathbb{R}$ or $\mathbb{K} = \mathbb{C}$. Prove that the *Euclidean norm*

$$\|x\| := \sqrt{\sum_{i=1}^{n} |x_i|^2},\ x = (x_1, ..., x_n) \in \mathbb{K}^n,$$

is a norm on the vector space $\mathbb{K}^n$, i.e. it satisfies

i)
$$\|x\| = 0 \iff x = 0,\ x \in \mathbb{K}^n,$$

ii)
$$\|\lambda \cdot x\| = |\lambda| \cdot \|x\|,\ \lambda \in \mathbb{K},\ x \in \mathbb{K}^n,$$

iii)

$$\|x+y\| \leq \|x\| + \|y\|,\ x,y \in \mathbb{K}^n\ (\textit{Triangle inequality}).$$

3. Consider the field $\mathbb{K} = \mathbb{R}$ or $\mathbb{K} = \mathbb{C}$. Show that for matrices $A,\ B \in M(n \times n, \mathbb{K})$ the *operator norm*

$$\|A\| := sup\{\|Ax\| : x \in \mathbb{K}^n \textit{ and } \|x\| \leq 1\}$$

is a norm on the vector space $M(n \times n, \mathbb{K})$, i.e. it satisfies

i)

$$\|A\| = 0 \iff A = 0,$$

ii)

$$\|\lambda \cdot A\| = |\lambda| \cdot \|A\|,\ \lambda \in \mathbb{K},$$

iii)

$$\|A+B\| \leq \|A\| + \|B\|\ (\textit{Triangle inequality}).$$

In addition show

iv)

$$\|A \cdot B\| \leq \|A\| \cdot \|B\|,$$

v)

$$\|\mathbb{1}\| = 1 \text{ with the unit matrix } \mathbb{1} \in M(n \times n, \mathbb{K}).$$

4. Consider the matrix

$$A := \begin{pmatrix} 3 & 4 & 3 \\ -1 & 0 & -1 \\ 1 & 2 & 3 \end{pmatrix} \in M(3 \times 3, \mathbb{C}).$$

i) Determine the characteristic polynomial of A.

ii) Determine the eigenvalues and eigenspaces of A.

iii) Is A diagonalizable?

Discussion: Tuesday, 25.10.2022, 12 p.m.

DEPARTMENT OF MATHEMATICS
LMU MÜNCHEN
WINTER TERM 2022/23

Joachim Wehler

Problems 02

5. The complex geometric series

$$\sum_{\nu=0}^{\infty} z^{\nu}$$

has radius of convergence $R = 1$. Hence the series

$$\sum_{\nu=0}^{\infty} A^{\nu} \in M(n \times n, \mathbb{C})$$

is well-defined for any matrix $A \in M(n \times n, \mathbb{C})$ with $\|A\| < 1$.

Show: The matrix $\mathbb{1} - A \in M(n \times n, \mathbb{C})$ is invertible with

$$(\mathbb{1} - A)^{-1} = \sum_{\nu=0}^{\infty} A^{\nu}.$$

Hint: Imitate the proof of the analogous result for the complex geometric series.

6. The complex logarithmic series

$$log(1+z) = \sum_{\nu=1}^{\infty} \frac{(-1)^{\nu+1}}{\nu} \cdot z^{\nu}$$

has radius of convergence $R = 1$. Hence the series

$$log(\mathbb{1} + A) := \sum_{\nu=1}^{\infty} (-1)^{\nu+1} \cdot \frac{A^{\nu}}{\nu} \in M(n \times n, \mathbb{C})$$

is well-defined for any matrix $A \in M(n \times n, \mathbb{C})$ with $\|A\| < 1$. Consider an open subset $I \subset \mathbb{R}$ and a differentiable function

$$B : I \to M(n \times n, \mathbb{C})$$

with $\|B(t) - \mathbb{1}\| < 1$ and $[B'(t), B(t)] = 0$ for all $t \in I$.

Show: For all $t \in I$ the inverse $B(t)^{-1}$ exists and

$$\frac{d}{dt} log\ B(t) = B(t)^{-1} \cdot B'(t) = B'(t) \cdot B(t)^{-1}.$$

Hint: In order to compute $B(t)^{-1}$ apply Problem 5 with $A := \mathbb{1} - B(t)$.

7. Consider the endomorphism $f \in End(\mathbb{C}^2)$ defined with respect to the canonical basis by the matrix

$$A = \begin{pmatrix} 1 & 2 \\ 0 & 3 \end{pmatrix} \in M(2 \times 2, \mathbb{C}).$$

i) Show that

$$A_s := \begin{pmatrix} 1 & 0 \\ 0 & 3 \end{pmatrix} \ (semisimple)$$

and

$$A_n := \begin{pmatrix} 0 & 2 \\ 0 & 0 \end{pmatrix} \ (nilpotent)$$

are not the matrices of the Jordan decomposition of f.

ii) Compute the matrices of the Jordan decomposition of f.

8. Provide the group

$$GL(n, \mathbb{K}) \subset \mathbb{K}^{n^2}$$

with the induced topology from the Euclidean space.

Show: Each open subgroup

$$H \subset GL(n, \mathbb{K})$$

is also closed.

Hint: You may use that a subspace is closed iff its complement is open.

Discussion: Tuesday, 8.11.2022, 12 p.m.

Joachim Wehler

Problems 03

9. Determine a matrix $A \in gl(2,\mathbb{C})$ with

$$exp\, A = \begin{pmatrix} -1 & b \\ 0 & -1 \end{pmatrix},\ b \in \mathbb{R}^*.$$

10. Consider a finite-dimensional complex vector space V and an endomorphism $f \in End\, V$. Show:

i) If f is diagonalizable then f is semisimple.

ii) If f is semisimple then f is diagonalizable.

Hint: You may use the decomposition $V = \bigoplus_\lambda V^\lambda(f)$ and prove:

$$p_{min}(T) = \prod_\lambda (T-\lambda) \implies V^\lambda(f) \subset V_\lambda(f).$$

iii) The sum of two semisimple, commuting endomorphisms of V is semisimple.

11. Consider a finite-dimensional $\mathbb{K}$-vector space V. Show:

The sum of two nilpotent, commuting endomorphisms of V is nilpotent.

12. Show that the subgroup of invertible matrices with rational entries

$$GL(2,\mathbb{Q}) \subset GL(2,\mathbb{C})$$

is not a matrix group.

Discussion: Tuesday, 15.11.2022, 12.15 p.m.

DEPARTMENT OF MATHEMATICS
LMU MÜNCHEN
WINTER TERM 2022/23

Joachim Wehler

Problems 04

13. For $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$ and $k \in \mathbb{N}^*$ denote by

$$\mathfrak{n}(k,\mathbb{K}) := \{(a_{ij}) \in M(k \times k, \mathbb{K}) : \ a_{ij} = 0 \text{ for } j \leq i\}$$

the Lie algebra of strictly upper triangular matrices and by

$$UP(k,\mathbb{K}) := \{\mathbb{1} + A \in GL(k,\mathbb{K}) : \ A \in \mathfrak{n}(k,\mathbb{K})\}$$

the group of unipotent matrices. Show:

i) The Lie algebra satisfies

$$Lie\ UP(k,\mathbb{K}) = \mathfrak{n}(k,\mathbb{K})$$

ii) The exponential map

$$exp : Lie\ UP(k,\mathbb{K}) \to UP(k,\mathbb{K})$$

is surjective and injective.

14. For the Lie algebra $L := gl(n,\mathbb{C})$ consider the adjoint representation

$$ad : L \to End\ L,\ X \mapsto ad_X,$$

with

$$ad_X : L \to L,\ (ad_X)(Y) := [X,Y]$$

For $\nu \in \mathbb{N}$ define the ν-th iteration

$$(ad_X)^\nu : L \to L,\ (ad_X)^\nu(Y) := [X,...[X,[X,Y]]...]$$

with ν-times the argument X.

i) Show by induction

$$(ad_X)^N(Y) = \sum_{\nu=0}^{N} \binom{N}{\nu} X^\nu \cdot Y \cdot (-X)^{N-\nu}$$

ii) Define

$$e^{ad_X} : L \to L,\ e^{ad_X}(Y) := \sum_{N=0}^{\infty} \frac{(ad_X)^N(Y)}{N!}$$

Show

$$(e^{ad_X})(Y) = e^X \cdot Y \cdot e^{-X}$$

15. Consider a pair of two matrices $X, Y \in M(n \times n, \mathbb{C})$ each of which commutes with the commutator, i.e.

$$[X,[X,Y]] = [Y,[X,Y]] = 0.$$

i) Show the equivalence

$$exp\ tX \cdot exp\ tY = exp\left(tX + tY + \frac{t^2}{2} \cdot [X,Y]\right)$$

$$\Longleftrightarrow$$

$$exp\ tX \cdot exp\ tY \cdot exp\left(-\frac{t^2}{2} \cdot [X,Y]\right) = exp(t(X+Y))$$

ii) Show that the two differentiable functions of the real parameter t

$$\mathbb{R} \to GL(n,\mathbb{C})$$

defined respectively as

$$exp(t(X+Y)) \text{ and } exp\ tX \cdot exp\ tY \cdot exp\left(-\frac{t^2}{2} \cdot [X,Y]\right)$$

satisfy the same linear ordinary differential equation with respect to t and the same initial condition for $t = 0$.

Hint: You may apply the product rule and combine the three resulting summands by using the functional equation of exp in the commutative case. Then in the first summand the term $X \cdot exp\ tY$ can be tansformed by the formula from Problem 14 and then simplified.

iii) Prove the adapted functional equation

$$exp\ X \cdot \exp\ Y = exp\left(X + Y + \frac{1}{2} \cdot [X,Y]\right)$$

16. Assume $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$ and denote by $UP(3,\mathbb{K}) \subset GL(3,\mathbb{K})$ the subgroup of unipotent matrices.

i) Show: The exponential map

$$exp : \mathfrak{n}(3,\mathbb{K}) \to UP(3,\mathbb{K})$$

satisfies

$$exp(X) \cdot exp(Y) = exp\left(X + Y + \frac{1}{2} \cdot [X,Y]\right)$$

ii) Define a group structure on $\mathfrak{n}(3,\mathbb{K})$ such that

$$exp : \mathfrak{n}(3,\mathbb{K}) \to UP(3,\mathbb{K})$$

becomes an isomorphism of groups.

Hint: You may apply the results of Problem 13 and 15.

Discussion: Tuesday, 22.11.2022, 12 p.m.

DEPARTMENT OF MATHEMATICS
LMU MÜNCHEN
WINTER TERM 2022/23

Joachim Wehler

Problems 05

17. For a matrix group G with surjective exponential map

$$exp : Lie\ G \to G$$

show: Each $g \in G$ has for each $n \in \mathbb{N}^*$ a n-th root $\sqrt[n]{g} \in G$, i.e. there exists

$$h \in G \text{ with } h^n = g.$$

18. For $j = 1,2,3$ compute explicitly the value of the 1-parameter subgroup of $SU(2)$ with infinitesimal generator $i \cdot \sigma_j \in su(2)$ with the Pauli matrix σ_j.

19. Assume the following results:

- For each representation of $su(2)$ on a finite dimensional complex vector space V

  $$\lambda : su(2) \to gl(V)$$

  exists a unique morphism of matrix groups

  $$\Lambda : SU(2) \to GL(V)$$

  such that the following diagram commutes

  $$\begin{array}{ccc} SU(2) & \overset{\Lambda}{\dashrightarrow} & GL(V) \\ \exp\uparrow & & \uparrow\exp \\ su(2) & \xrightarrow{\lambda} & gl(V) \end{array}$$

- For each $n \in \mathbb{N}$ exists a representation

  $$\rho_n : sl(2,\mathbb{C}) \to gl(V_n)$$

  with an $(n+1)$-dimensional complex vector space

$$V_n = span_{\mathbb{C}} < e_0, ..., e_n >$$

and the $sl(2,\mathbb{C})$-action: For $j = 0, ..., n$

$h.e_j = (n-2j)\cdot e_j$, $x.e_j = (n-j+1)\cdot e_{j-1}$, $y.e_j = (j+1)\cdot e_{j+1}$; $e_{n+1} := e_{-1} := 0$

for the elements

$$h := \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix},\ x := \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix},\ y = \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} \in sl(2,\mathbb{C})$$

Define the restriction to $su(2)$ as

$$\lambda_n := \rho_n | su(2) : su(2) \to gl(V_n),\ n \in \mathbb{N}.$$

Show the equivalence of the following two properties:

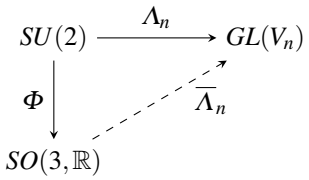
- The parameter $n \in \mathbb{N}$ is even.
- For the induced morphism of matrix groups

  $$\Lambda_n : SU(2) \to GL(V_n)$$

  with tangent map λ_n exists a morphism of matrix groups

  $$\overline{\Lambda}_n : SO(3,\mathbb{R}) \to GL(V_n)$$

  such that the following diagram - with Φ the universal covering - commutes



Note: The group morphisms Λ_n with odd $n \in \mathbb{N}$ are named the *spinor representations* of $SU(2)$.

20. Consider a Lie algebra L and an ideal $I \subset L$. Assume: The Lie algebra L/I is nilpotent and for all $x \in L$ the restricted endomorphism

$$(ad\ x)|I : I \to I$$

is nilpotent. Show: The Lie algebra L is nilpotent.

Discussion: Tuesday, 29.11.2022, 12 p.m.

LMU MÜNCHEN
WINTER TERM 2022/23

LIE ALGEBRAS

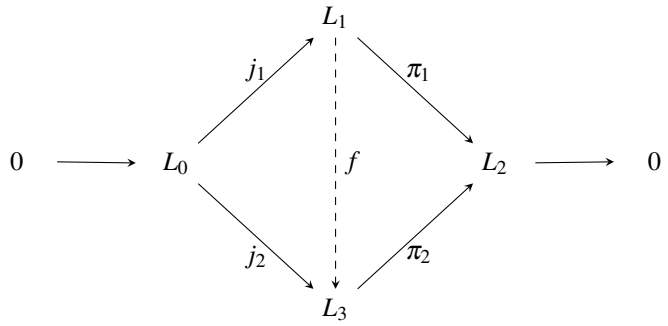
Joachim Wehler

Problems 06

21. Consider the following diagram with two short exact sequences of morphisms of Lie algebras, and assume the existence of a morphism

$$f : L_1 \to L_3$$

which makes the diagram commutative:



Show that f is an isomorphism of Lie algebras.

22. Consider a Lie algebra L. Show:

i) For two nilpotent ideals $I, J \subset L$ also the sum $I + Y \subset L$ is a nilpotent ideal.

ii) There exists a unique maximal nilpotent ideal in L (named the *nilradical* of L).

23. Consider a nilpotent $\mathbb{K}$-Lie algebra $L \neq \{0\}$. Show:

i) There exists a $\mathbb{K}$-vector space decomposition

$$L = I \oplus \mathbb{K} \cdot x_0$$

with an ideal $I \subset L$ and a non-zero element $x_0 \in L$.

ii) The centralizer of I satisfies

$$C_L(I) \neq \{0\},$$

and there exists a maximal exponent $n \in \mathbb{N}$ with

$$C_L(I) \subset C^n L.$$

iii) There exists an outer derivation of L, i.e. a derivation

$$D : L \to L$$

which does not have the form

$$D = ad\ u \ \text{ with } u \in L.$$

Hint: You may use $C_L(I) \setminus C^{n+1}L \neq \emptyset$.

24. Determine explicitly an outer derivation of the Lie algebra $\mathfrak{n}(3, \mathbb{K})$.

Discussion: Tuesday, 6.12.2022, 12 p.m.

DEPARTMENT OF MATHEMATICS

WINTER TERM 2022/23

Joachim Wehler

Problems 07

25. Determine the center $Z(heis(n))$ of the Heisenberg algebra.

26. For $n \in \mathbb{N}$ consider the vector space of square matrices

$$M := M(n \times n, \mathbb{K}),$$

and the symmetric bilinear trace form

$$\beta : M \times M \to \mathbb{K},\ \beta(A,B) := trace\ (A \cdot B)$$

For each subspace $V \subset M$ denote by

$$V^{\perp} := \{A \in M :\ \beta(A, \mathrm{v}) = 0 \ \text{ for all } \mathrm{v} \in V\}$$

the orthogonal space of V. Show:

i) The form β is non-degenerate, i.e. $M^{\perp} = \{0\}$.

ii) The canonical map to the dual space

$$j_{\beta} : M \to M^*,\ A \mapsto \beta(A, -),$$

is an isomorphism of $\mathbb{K}$-vector spaces.

iii) For each vector subspace $V \subset M$ holds

$$j_{\beta}(V^{\perp}) = V^0 := \{\lambda \in M^* :\ \lambda | V = 0\}$$

and j_{β} induces an isomorphism

$$M/V^{\perp} \xrightarrow{\simeq} V^*$$

27. For $n \in \mathbb{N}$ consider the group

$$AF(n,\mathbb{K}) := \{\mathbb{K}^n \to \mathbb{K}^n,\ \mathrm{v} \mapsto A \cdot \mathrm{v} + b :\ A \in GL(n,\mathbb{K}),\ b \in \mathbb{K}^n\}$$

of affine automorphisms of $\mathbb{K}^n$.

i) Show: The group $AF(n,\mathbb{K})$ is isomorphic to a matrix group $G \subset GL(n+1,\mathbb{K})$. In the following identify

$$AF(n,\mathbb{K}) \text{ and } G.$$

ii) Compute the Lie algebra

$$af(n,\mathbb{K}) := Lie\, AF(n,\mathbb{K})$$

iii) Show that $af(n,\mathbb{K})$ is a semidirect product

$$I \rtimes_\theta M$$

with two $\mathbb{K}$-Lie algebras I and M, and a suitable morphism of Lie algebras

$$\theta : M \to Der(I)$$

28. Consider the Lie algebra $sl(2,\mathbb{K})$ and its standard basis $(e_i)_{i=1,2,3}$ with

$$e_1 := h := \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix},\ e_2 := x := \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix},\ e_3 := y := \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix} \in sl(2,\mathbb{K})$$

i) With respect to the standard basis compute the matrices from $M(2\times 2,\mathbb{K})$ of the endomorphisms of $sl(2,\mathbb{K})$

$$ad\ h,\ ad\ x,\ ad\ y.$$

ii) Determine the Killing form of $sl(2,\mathbb{K})$ with respect to the standard basis, i.e. determine the matrix

$$Q = (\kappa(e_i,e_j))_{1\le i,j\le 3}$$

iii) Determine the rank and the eigenvalues of Q.

Discussion: Tuesday, 13.12.2022, 12 p.m.

Joachim Wehler

Problems 08 (*Repetition*)

The present problem sheet contains questions related to some definitions, propositions, theorems and problems from the lecture and the corresponding exercises. Intentionally, the questions are not arranged in a logical order.

1. Which classes of Lie algebras do you know? Give the definition of each class.
2. Is any nilpotent Lie algebra also solvable?
3. What is the content of the Cartan criterion for solvability?
4. What does Lie's theorem state, why does one need the complex numbers as base field?
5. How is the Killing form defined? Give some applications of the Killing form.
6. Set
$$A = \begin{pmatrix} \lambda & b \\ 0 & \lambda \end{pmatrix},\ \lambda \in \mathbb{K}.$$
Determine the minimal polynomial $p_{min}(T)$ of A and its characteristic polynomial $p_{char}(T)$. How do they relate?
7. Give the definition of the trace form of a representation?
8. Set
$$B = \begin{pmatrix} 1 & 2 \\ 0 & 3 \end{pmatrix}.$$
Why are the matrices
$$B_s = \begin{pmatrix} 1 & 0 \\ 0 & 3 \end{pmatrix} \text{ and } B_n = \begin{pmatrix} 0 & 2 \\ 0 & 0 \end{pmatrix}$$
not the summands of the Jordan decomposition of B?
9. What is the content of the Cartan criterion for semisimpleness?
10. State the Jacobi identity.
11. State the definition of a representation of a Lie algebra.
12. For which class of Lie algebras is the adjoint representation faithful?
13. State the definition and some properties of the exponential map of matrices.
14. Give an example of an infinite matrix series. For which matrices does the series converge?
15. State the difference between the matrix product and the Lie bracket of Lie algebras.
16. What are derivations, how do they relate to the adjoint representation?

17. State the definition and name some properties of the Killing form.
18. How do $p_{min}(T)$ and $p_{char}(T)$ relate for general square matrices?
19. What about surjectivity of the exponential map?
20. State the definition and some properties of the Heisenberg Lie algebra.
21. State the main theorem about nilpotent Lie algebras.
22. Define the semidirect product of two Lie algebras. How does it relate to the direct product?
23. How does a semisimple Lie algebra split?
24. Give the definition of the orthogonal space of an ideal in a semisimple Lie algebra, and state its property.
25. State the definition of the Lie algebra of a matrix group.
26. How is the adjoint representation defined?
27. State the main theorem about solvable Lie algebras.
28. Name some of the classical matrix groups and derive their Lie algebras.
29. State the definition of a 1-parameter group.
30. State the definition of a connected topological space.
31. Describe the universal covering projection of $SO(3,\mathbb{R})$.
32. How does the dynamic Lie algebra of quantum mechanics relate to the Heisenberg algebra?
33. State the general form of nilpotent matrix Lie algebras?
34. State the definition of the fundamental group of a connected topological space.
35. State Weyl's theorem on complete reducibility.
36. Describe the universal covering projection of the identity component of the Lorentz group.
37. How does respectively nilpotency and solvability behave in short exact sequences of Lie algebra morphisms?
38. Characterize semisimpleness of a Lie algebra by its radical.
39. When does a short exact sequence of Lie algebra morphisms split? What does splitting imply?
40. Name some applications of the Jordan decomposition in Lie algebra theory.
41. State some types of induced representations. Prove that they are representations.
42. Give some examples from classical matrix groups which are simply connected and others which are not simply connnected.

Discussion: Tuesday, 10.1.2023, 12 p.m.

Problems 09

29. For the Lie algebra

$$L := sl(n,\mathbb{C}),\ n \in \mathbb{N},$$

show: The subalgebra of diagonal matrices

$$\mathfrak{d}(n,\mathbb{C}) \cap L$$

is a maximal toral subalgebra of L.

30. Consider a simple complex Lie algebra L and two bilinear symmetric forms

$$\beta,\ \gamma : L \times L \to \mathbb{C}$$

which are non-degenerate and satisfy for $x,y,z \in L$ the "associativity"

$$\beta([x,y],z) = \beta(x,[y,z]),\ \gamma([x,y],z) = \gamma(x,[y,z]).$$

Show: There exists a scalar $\mu \in \mathbb{C}^*$ satisfying

$$\beta = \mu \cdot \gamma$$

31. For

$$L := sl(2,\mathbb{C})$$

consider the Kiling form κ and the trace form

$$tr : L \times L \to \mathbb{C},\ tr(x,y) := trace(x \circ y).$$

Determine $\mu \in \mathbb{C}^*$ with

$$\kappa = \mu \cdot tr$$

32. i) For an Abelian Lie algebra I show: Each endomorphism of the vector space I is a derivation of the Lie Algebra I, i.e.

$$gl(I) = Der(I).$$

ii) Consider a Lie algebra S and an Abelian Lie algebra I. Due to part i) each representation

$$\rho : S \to gl(I)$$

satisfies $\rho(S) \subset Der(I)$. Therefore the semidirect product

$$L := I \rtimes_\rho S$$

is a well-defined Lie algebra, fitting into the exact sequence of Lie algebras

$$0 \to I \xrightarrow{j} L \xrightarrow{\pi} S \to 0.$$

Denote by

$$s : S \to L$$

a section against π. Assume S semisimple, and the representation $\rho : S \to gl(I)$ non-zero and irreducible. Show:

a) *Derived algebra*: $L = [L, L]$

b) *Center*: $Z(L) = \{0\}$.

c) *No factorizing as direct product*: There does not exist a pair (L_1, L_2) of Lie algebras with L_1 semisimple and L_2 solvable, such that

$$L \simeq L_1 \times L_2.$$

In particular, L is not semisimple.

Hint: ad a) Consider $I \subset L,\ S \subset L$ and verify $\rho(S)(I) = I$. Conclude $[I, S]_L = I$. Show $[S, S]_L = S$. ad b) From $(i, s) \in Z(L)$ conclude $s = 0$.

Discussion: Tuesday, 17.1.2023, 12 p.m.

Problems 10

We set $L := sl(2,\mathbb{C})$ for all problems on the present problem sheet.

33. Consider two L-modules U and W. Show:

If $u \in U$ is a weight vector of weight λ_u and $w \in W$ a weight vector of weight λ_w, then the tensor product

$$u \otimes w \in U \otimes_{\mathbb{C}} W$$

is a weight vector of weight $\lambda_u + \lambda_w$.

34. Consider the injection of Lie algebras

$$j : L \hookrightarrow sl(3,\mathbb{C}),\ A \mapsto j(A) := \begin{pmatrix} A & 0 \\ 0 & 0 \end{pmatrix},$$

considered as a block matrix.

i) Show: With respect to the representation

$$\rho : L \to gl(sl(3,\mathbb{C})),\ z \mapsto ad\ j(z),$$

the L-module $sl(3,\mathbb{C})$ is reducible.

ii) Why is the L-module $sl(3,\mathbb{C})$ from part i) completely reducible? Determine the isomorphism classes of the irreducible L-modules from the splitting of $sl(3,\mathbb{C})$.

35. Denote by $V(\lambda)$ the irreducible L-module with highest weight λ.

Determine the irreducible components of the L-module

$$V(4) \otimes_{\mathbb{C}} V(7)$$

36. For arbitrary $p, q \in \mathbb{Z}_+$ determine the weights of the L-module

$$V(p) \otimes_{\mathbb{C}} V(q)$$

and the dimension of their weight spaces.

Problems 11

37. i) Show the isomorphy of complex Lie algebras

$$so(4,\mathbb{C}) \simeq so(3,\mathbb{C}) \oplus so(3,\mathbb{C})$$

ii) Determine the root sets of $so(3,\mathbb{C})$ and of $so(4,\mathbb{C})$, the root space decomposition of $so(4,\mathbb{C})$, and explicit generators of each root space of $so(4,\mathbb{C})$.

iii) Determine the rank and a base of the root systems of $so(3,\mathbb{C})$ and $so(4,\mathbb{C})$.

Hint: ad i) Define a suitable injective map $so(3,\mathbb{C}) \oplus so(3,\mathbb{C}) \to so(4,\mathbb{C})$.
ad ii) Use suitable generators of $so(3,\mathbb{C})$.

For the following Problems 38 and 39 set $L := sl(3,\mathbb{C})$.

38. i) Choose a maximal toral subalgebra $T \subset L$ and determine explicitly a vector space basis $(h_j)_{j\in I}$ of T.

ii) Determine the root set Φ of L with respect to T and a base Δ of the root system $R = (\mathbb{R}^2, \Phi)$.

iii) Compute the root space decomposition of L: For each positive root $\alpha \in \Phi^+$ determine root vectors

$$x_\alpha \in L^\alpha,\ y_\alpha \in L^{-\alpha}$$

such that the subalgebra of L

$$L_\alpha := span_{\mathbb{C}} < x_\alpha,\ y_\alpha,\ h_\alpha := [x_\alpha, y_\alpha] >$$

is isomorphic to

$$sl(2,\mathbb{C}).$$

39. Denote by Φ the root set of L with respect to a maximal toral subalgebra $T \subset L$, and by

$$V := span_{\mathbb{R}} \Phi$$

the real vector space spanned by the roots $\alpha \in \Phi$.

i) Determine the rank of the root system $R := (V, \Phi)$ of L.

ii) Determine the Cartan matrix of R.

40. Compute the Weyl group of the root system of $so(4, \mathbb{C})$ and of the root system of $sl(3, \mathbb{C})$

Problems 12 (*Repetition*)

The present problem sheet contains questions related to some definitions, propositions, theorems and problems from the lecture and the corresponding exercises. Intentionally, the questions are not arranged in a logical order.

41. 1. Name a maximal toral subalgebra of $sl(2,\mathbb{C})$ and more general of $sl(n,\mathbb{C})$.
2. What is a Cartan integer?
3. Describe the irreducible finite-dimensional $sl(2,\mathbb{C})$-modules.
4. Describe the structure of the Lie algebra $sl(2,\mathbb{C})$.
5. Which role plays the Lie algebra $so(3,\mathbb{C})$ in physics?
6. How to obtain all complex representations of the matrix group $SO(3,\mathbb{R})$?
7. What is a base of a root system? Why is the concept important?
8. What is a primitive element, and why is the concept important?
9. In which respect differ the Coxeter graph and the Dynkin diagram of a root system?
10. How do the Lie algebras $su(n)$ and $sl(n,\mathbb{C})$ relate to each other?
11. Is the base of a root system uniquely determined?
12. What are ladder operators?
13. Define the concept of a root system. Why are root systems important?
14. Define the Lie algebra of the angular momentum and its commutator relations.
15. Which conditions on two bases of a root system ensure that they define isomorphic root systems?
16. How do the Lie algebras $sl(2,\mathbb{C})$ and $so(3,\mathbb{C})$ relate to each other?
17. How to obtain all representations of the matrix group $SU(n)$?
18. Write down the Cartan matrices of bases of $sl(2,\mathbb{C})$ and $so(4,\mathbb{C})$. Explain their form.
19. Which concept is the Weyl group of a root system, and why is the concept important?
20. Determine the weight spaces of an irreducible finite-dimensional $sl(2,\mathbb{C})$-module and their dimensions.
21. Which Cartan integers are possible for the root system of a semisimple complex Lie algebra?

Discussion: Tuesday, 7.2.2023, 12 p.m.
